

AMENDMENTS TO THE CLAIMS

1. (Original) A strain sensor which consists of a polymer that has been irradiated with less than 1×10^{15} ions /cm in a portion of its surface with conducting tracks deposited onto the treated portion to enable the sensor to be connected to an external electric circuit.

2. (Original) A strain sensor as claimed in claim 1 in which the polymer is a polyimide film.

3. (Original) A method of forming a strain sensor from a polymeric film which includes the steps of selectively irradiating a surface of the polymer with high energy radiation to change the composition of the polymer and increase the electrical conductivity in selected portions of the surface.

4. (Original) A method as claimed in claim 3 in which the high energy radiation carbonizes the polymer to form conductive particles in the polymer.

5. (Original) A method as claimed in claim 3 in which high energy ions impinge on a polymer film containing precursor metal compounds, such that decomposition of the precursor leads to nucleation of conducting metal particles.

6. (Currently amended) A method as claimed in ~~any preceding claim~~ claim 3 in which the polymer is a polyimide.

7. (Currently amended) A method as claimed in ~~any preceding claim~~ claim 3 in which conducting tracks are deposited onto the treated polymer to enable the device to be connected to an external electric circuit.

8. (Currently amended) A strain sensor made by the method of any one of ~~claims 3 to 7~~ claim 3.
